

Remittance Prices Worldwide

Issue n. 15, October 2015

This Report reflects the latest trends observed in the data published in October 2015. Remittance Prices Worldwide is available at <http://remittanceprices.worldbank.org>

Overview

Remittance Prices Worldwide (RPW) monitors remittance prices across all geographic regions of the world. Launched in September 2008, RPW remains a key tool to monitor the cost incurred by remitters when sending money along major remittance corridors. RPW covers 32 remittance sending countries and 89 receiving countries, for a total of 227 country corridors worldwide.

This Report uses data from RPW's most recent release to analyze the global, regional, and country specific trends in the average total cost of migrant remittances, as well as the factors influencing them.

RPW is used as a reference for measuring progress towards the "5x5" objective, which has been endorsed by the G8 and the G20 and is being pursued in partnership with governments, service providers, and other stakeholders.

Key Findings

Based on the data collected for the Q3 2015 release of RPW, and when compared to previous iterations,ⁱ the following main findings have been identified.ⁱⁱ

- In Q3 2015, the Global Average total cost of sending remittances experienced a modest decline to 7.52 percent, down from 7.68 percent in the previous quarter.
- The International MTO Index decreased slightly compared to last quarter and now stands at 8.04 percent in Q3 2015, down from 8.16 percent in Q2 2015.
- The Global Weighted Average remained substantially stable for the third consecutive quarter and was recorded at 5.91 percent in Q3 2015.
- In Q3 2015, 80 percent of corridors had an average total cost below 10 percent compared to only half in 2009 and, in the same time period, the percentage of corridors with average cost over 15 percent has been reduced by two-thirds.
- The average cost of sending remittances from the G8 countries was recorded at 7.02 percent in Q3 2015. France and the UK were the only two G8 countries not to experience a decline over the last quarter.
- In Q3 2015, the cost of sending remittances from G20 countries was recorded at 7.42 percent, a modest decline from 7.58 percent recorded in the previous quarter. The average cost of sending money to the G20 countries that are included in RPW as receiving markets also decreased and was recorded at 7.64 percent, compared to 8.08 percent in Q2 2015.
- In Q3 2015, the changes in the cost of sending remittances by region were relatively small for most regions.ⁱⁱⁱ LAC experienced a significant decrease from 6.78 percent to 6.29 percent. SA remains the least costly region to send money to, and SSA remains the most expensive.
- Commercial banks (10.64 percent) remained the most expensive of all Remittance Service Provider (RSP) types, followed by MTOs (6.51 percent) and Post Offices (6.04 percent).
- Cash services remain the most widely represented in the sample (47 percent of the sample), followed by account to account services (20 percent of the sample) and online products (18 percent of the sample). Online services are also the least expensive product type at 5.43 percent, while account to account products are the most expensive product type (10.83 percent) and cash services stand at 6.89.

Global trends

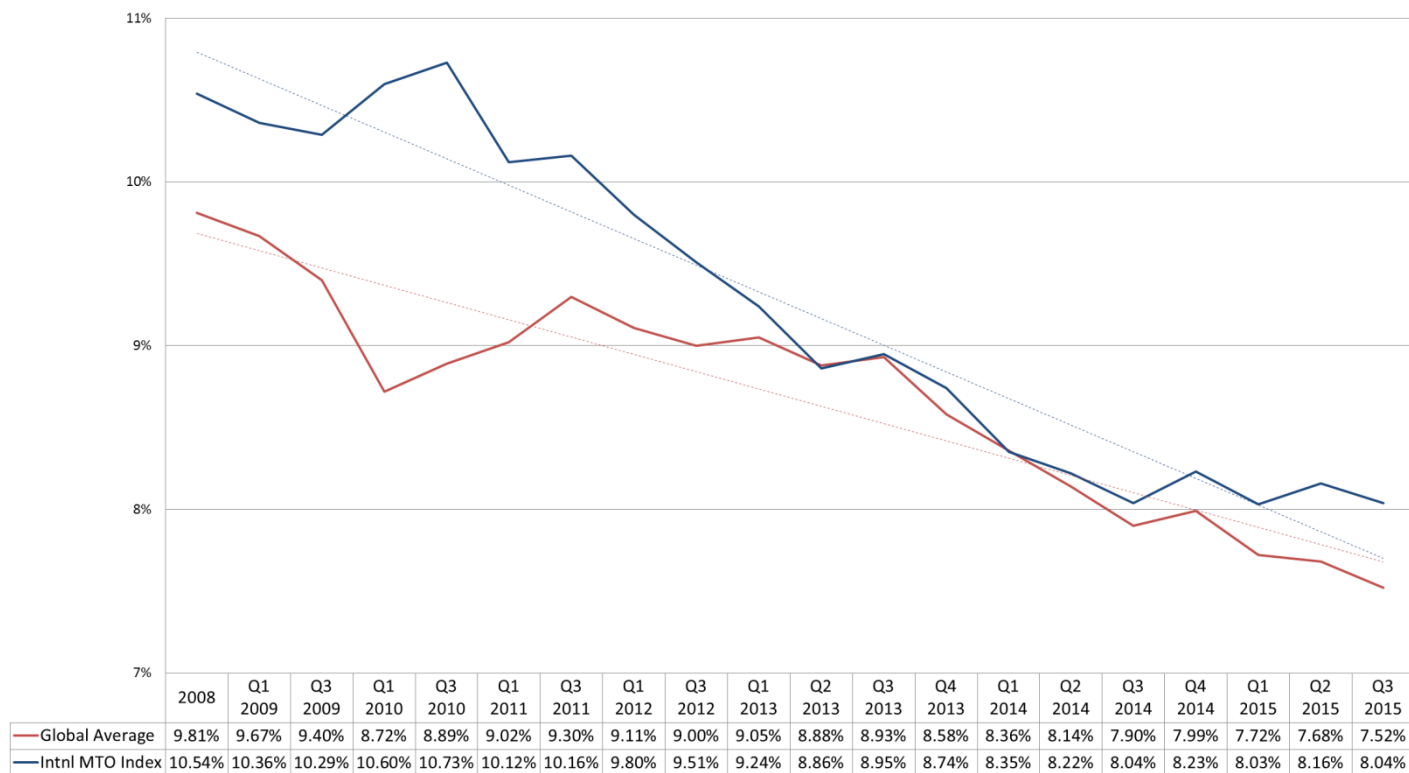

Global Average Total Cost reaches new lifetime low

In Q3 2015, the Global Average total cost for sending remittances was recorded at 7.52 percent – representing a 0.16 percentage point decline compared to the previous quarter when the average was 7.68 percent – and has remained below 8 percent for the last year (see Figure 1 and Table 1 in the Annex). This represents a decline of 2.15 percentage points over the last six years, as in Q1 2009 the same figure was recorded at 9.67 percent.

International MTO Index declines slightly in Q3 2015

The International MTO Index tracks the prices of MTOs that are present in at least 85 percent of corridors covered in the RPW database.^{iv} A convergence between the Global Average and the Intl MTO Index was first noted in Q1 2014. The Index experienced a modest decline from 8.16 percent in Q2 2015 to 8.04 percent in Q3 2015 and is now equal to the level recorded one year ago in Q3 2014.

Figure 1 Global Average Total Cost for sending USD 200^v

Global Weighted Average remains essentially stable, remaining just below 6 percent

In addition to the Global Average, a global weighted average total cost is calculated, which accounts for the relative size of the flows in each remittance corridor.^{vi} The Global Weighted Average of sending remittances, as illustrated in Figure 2 (see also Table 1 in the Annex), has at times shown a different pattern from the simple average. Over the last four quarters, the Global Weighted Average has remained substantially stable and now stands at 5.91 percent.

Figure 2 Global Weighted Average for sending USD 200

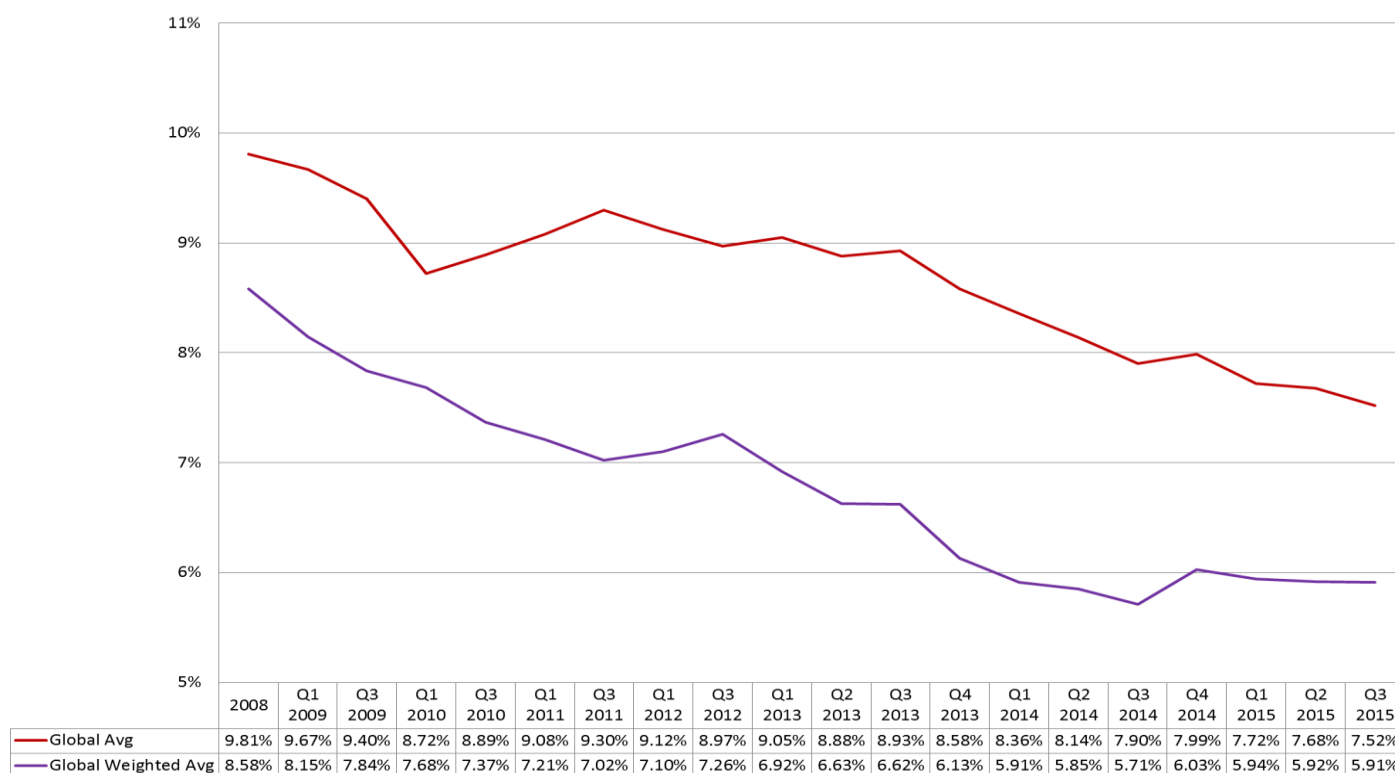

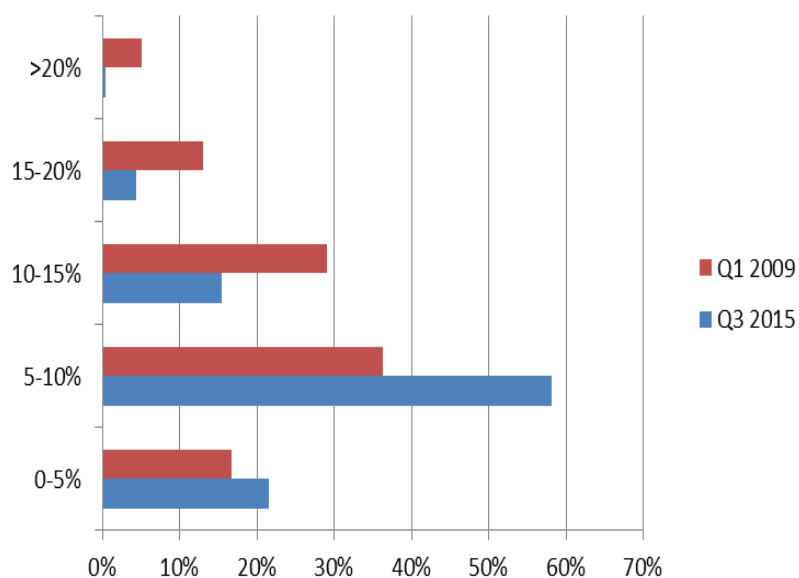

Figure 3 Distribution of Average Total Costs

Corridor level trends

Figure 3 shows that the overall downward trend reflected in the Global Average is even more evident when looking at the level of individual corridors. The percentage of corridors where remitters could pay between 0 and 10 percent on average to send money home has increased significantly since 2009 – just about half of corridors in Q1 2009 compared to 80 percent of RPW corridors in Q3 2015.

For the higher bands, the percentage has dropped: the proportion of corridors with an average total cost above 15 percent is one third of what it was in Q1 2009.

G8 and G20 countries

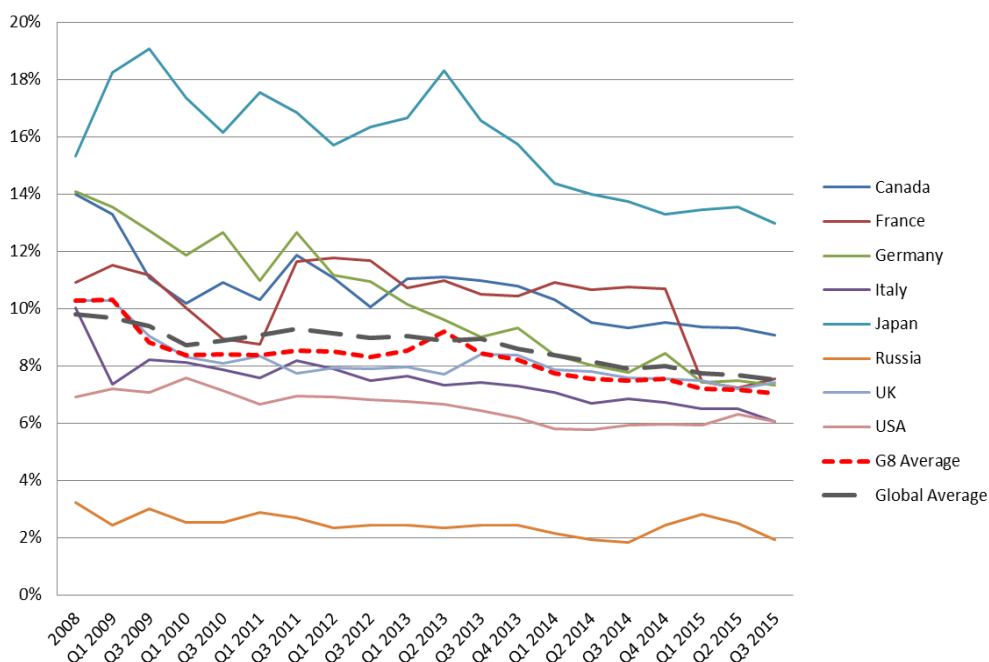

Average cost of sending from G8 countries remains largely stable

The G8 countries include the major sending countries in the world. The average cost for sending remittances from the G8 countries remained experienced a modest decline from 7.17 percent in Q2 2015 and now stands at 7.02 percent. This represents a new lifetime low for G8 sending countries and nearly half of a percentage point decline in the last year.

As Figure 4 illustrates, there are significant disparities in the cost structure across these countries (see also Table 2 in the Annex). The average cost of sending money from Japan and Canada are consistently above both the Global Average and the G8 average, while costs in Russia, the United States, and Italy are consistently below. France and Germany, until recently, were among the countries listed as consistently below, but both countries have converged towards the global average. The UK tends to oscillate between the two – typically above G8 average but below Global Average.

In Q3 2015, all but two G8 countries – France and the UK – experienced at least some decline, however modest.

Figure 4 Total average in G8 countries

The largest declines were seen in Russia (2.51 to 1.92 percent), Italy (6.49 to 6.05 percent) and Japan (13.55 to 12.97 percent). Despite this decline, Japan remains the most expensive G8 sending country. Russia remains the least expensive sending country. More modest declines were also recorded in Canada (9.31 to 9.08 percent), Germany 7.48 to 7.32 percent), and the USA (6.30 to 6.04 percent). The cost of sending remittances from France and the UK increased in Q3 2015, from 7.22 to 7.55 percent for France and from 7.20 to 7.44 percent for the UK.

Cost of sending remittances from and to the G20 countries declines

With the exception of Q3 2009, the cost of remitting from G20 countries^{vii} followed the same pattern as the Global Average, until Q1 2013. In Q2 2013, the two figures began to move in opposite directions, and continued to do so every quarter, with the exception of Q4 2013, when both indices declined. Once again, the cost of remitting from the G20 countries moved in the opposite direction to the Global Average cost in Q1 2014, but beginning in the following quarter, both indices have moved in sync in the following six quarters, as shown in Figure 5 (see also Table 2 in the Annex). The cost of remitting from G20 countries was recorded at 7.42 percent in Q3 2015, down from 7.58 percent in Q2 2015.

Figure 5 Average cost of sending USD 200 from G20 countries

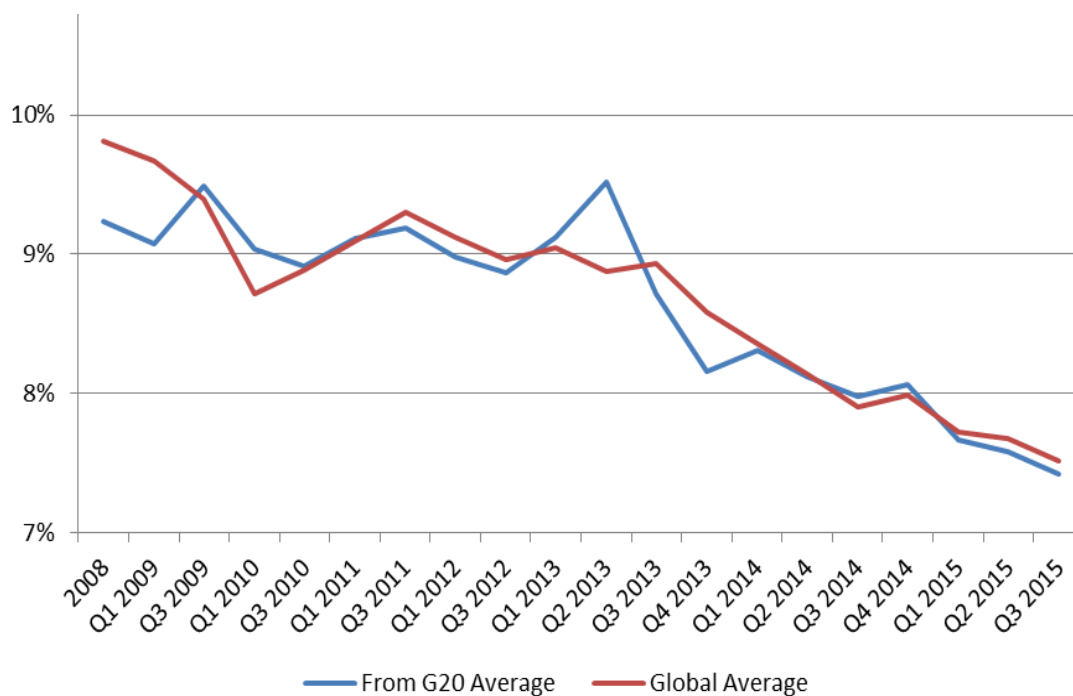

Figure 6 Average cost of remitting from G20 countries in Q3 2015

South Africa remains the most costly G20 country to send remittances from (see Figure 5), and this is despite a decline of about 5 percentage points in the last two years, when the cost of sending from South Africa was in excess of 20 percent. The cost of sending from the second most expensive G20 sending country – Japan – was recorded at 12.97 percent, falling below 13 percent for the first time since inception of RPW in 2008. Russia remains the least expensive G20 sending country, followed by Saudi Arabia (4.13 percent), Korea (5.43 percent) and the USA (6.04 percent).

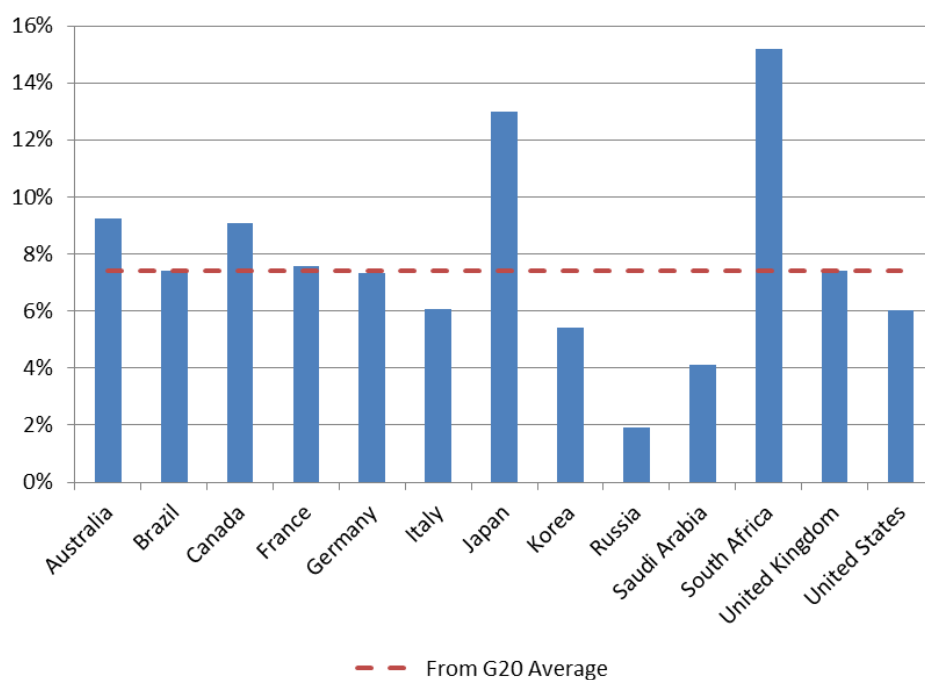

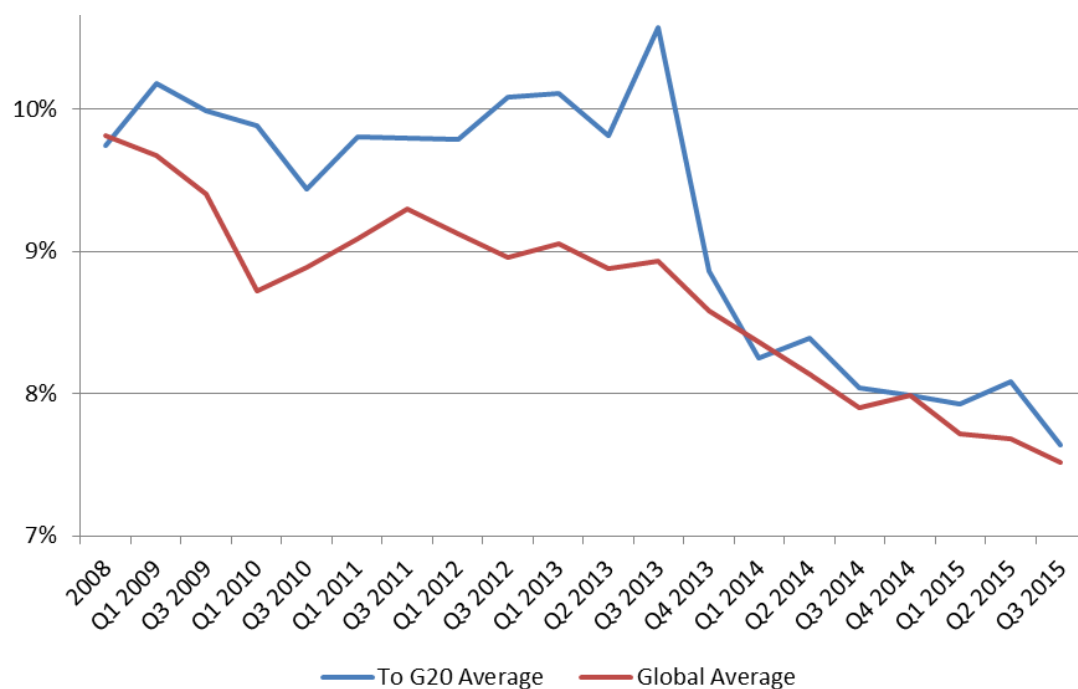

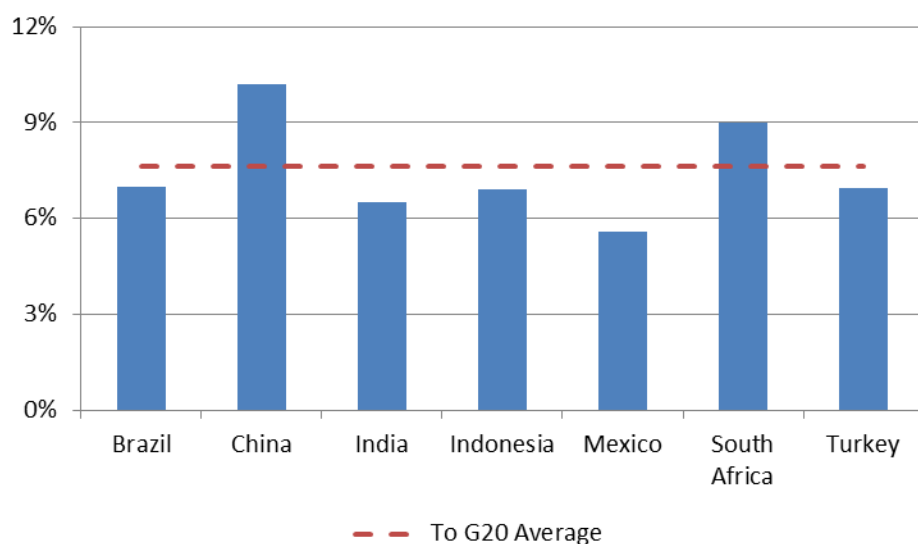

Figure 7 Average cost of sending USD 200 from G20 countries

The average cost of sending money to the G20 countries that are included in RPW as receiving markets was recorded at 7.64 percent in Q3 2015, decreasing from 8.08 percent in Q2 2015. Apart from a few quarters, the average cost of sending money to the G20 countries has followed the pattern of the Global Average. The disparity between the average cost of sending money to the G20 and the Global Average increased over time, and reached a peak in Q3 2013 (see Figure 7 and Table 3 in the Annex). The convergence between the two figures – a narrowing of the distance between the two indices first noted in Q4 2013 – continued to the present time. The cost of sending money to G20

Figure 8 Average cost of remitting to G20 countries in Q2 2015

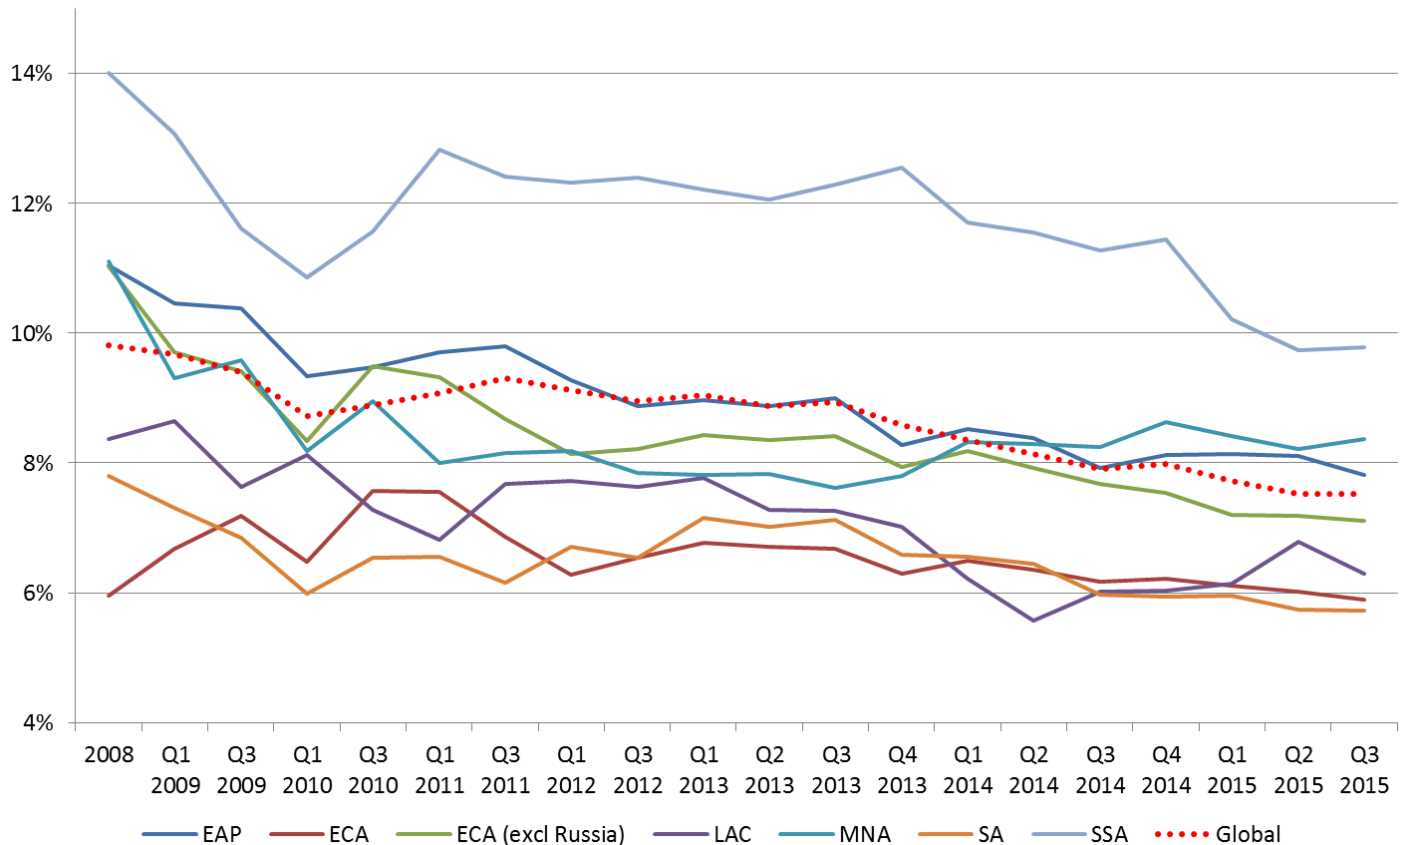

countries is once again slightly above the Global Average and moving in the same direction.

In Q3 2015, China was the most expensive country in the G20 to send money to, with an average cost of 10.18 percent (Figure 8), followed by South Africa (8.98 percent). Mexico and India were the cheapest receiving markets in the G20 group, with averages of 5.59 and 6.65 percent, respectively.

Regional trends

The cost for remittance services varies significantly depending on the region where the money is being sent (see Figure 9 and Table 4 in the Annex). Different trends were observed in different regions.

Figure 9 Average total costs by region of the world

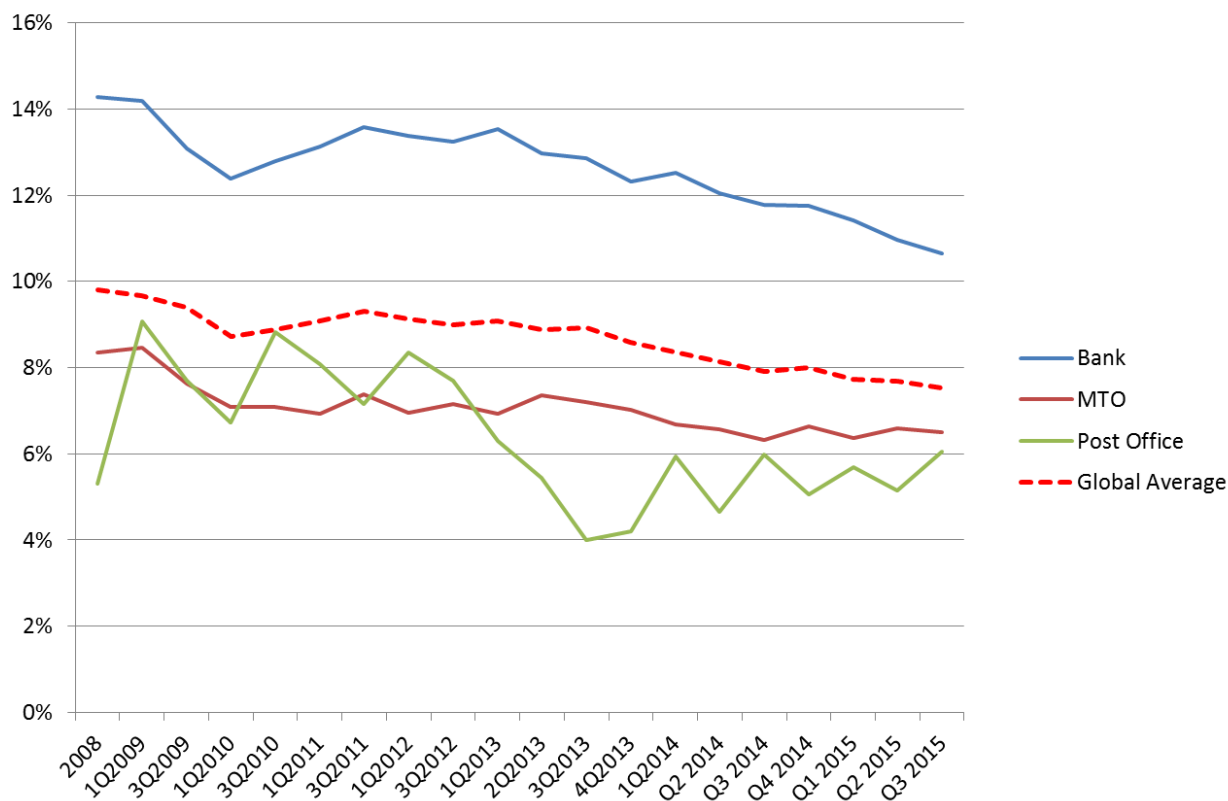

The most meaningful change in Q3 2015 was a decline in the cost of sending remittances to the Latin America and Caribbean region (LAC) region, which decreased from 6.78 to 6.29 percent. All other regions experienced very modest changes or remained essentially stable. South Asia (5.73 percent) maintains its position as least costly region to send money to, while Sub-Saharan Africa – still the most expensive region – stays below 10 percent for the second consecutive quarter. The cost of sending remittances by region in Q3 2015, beginning with the most expensive, were 9.78 for Sub-Saharan Africa (SSA), 8.37 percent for the Middle East and North Africa region (MNA) region, 7.82 percent for the East Asia and Pacific region (EAP) region, 6.29 percent for the LAC region, 5.89 for the Eastern Europe and Central Asia (ECA) region, and 5.73 for the South Asian region (SAR). Due to the peculiarity of the Russian market and its heavy influence on the ECA region, an additional value for the ECA region, excluding Russia, has been calculated and considered: the average excluding Russia was recorded at 7.10 percent – more than 1 percentage point higher than the average including Russia.

Costs by RSP Type

RPW tracks the cost of sending remittances for three main RSP types; commercial banks, MTOs, and post offices. Based on the data from Q3 2015 (see Figure 10), banks (10.64 percent) continue to be the most costly RSP type, despite a modest decrease. Although the cost for banks has remained below 11 percent for the second consecutive quarter, it also remains significantly higher than the Global Average, and it is also well above that of using post offices and MTOs, which are 6.05 and 6.51 percent, respectively.

Figure 10 Total averages by RSP type

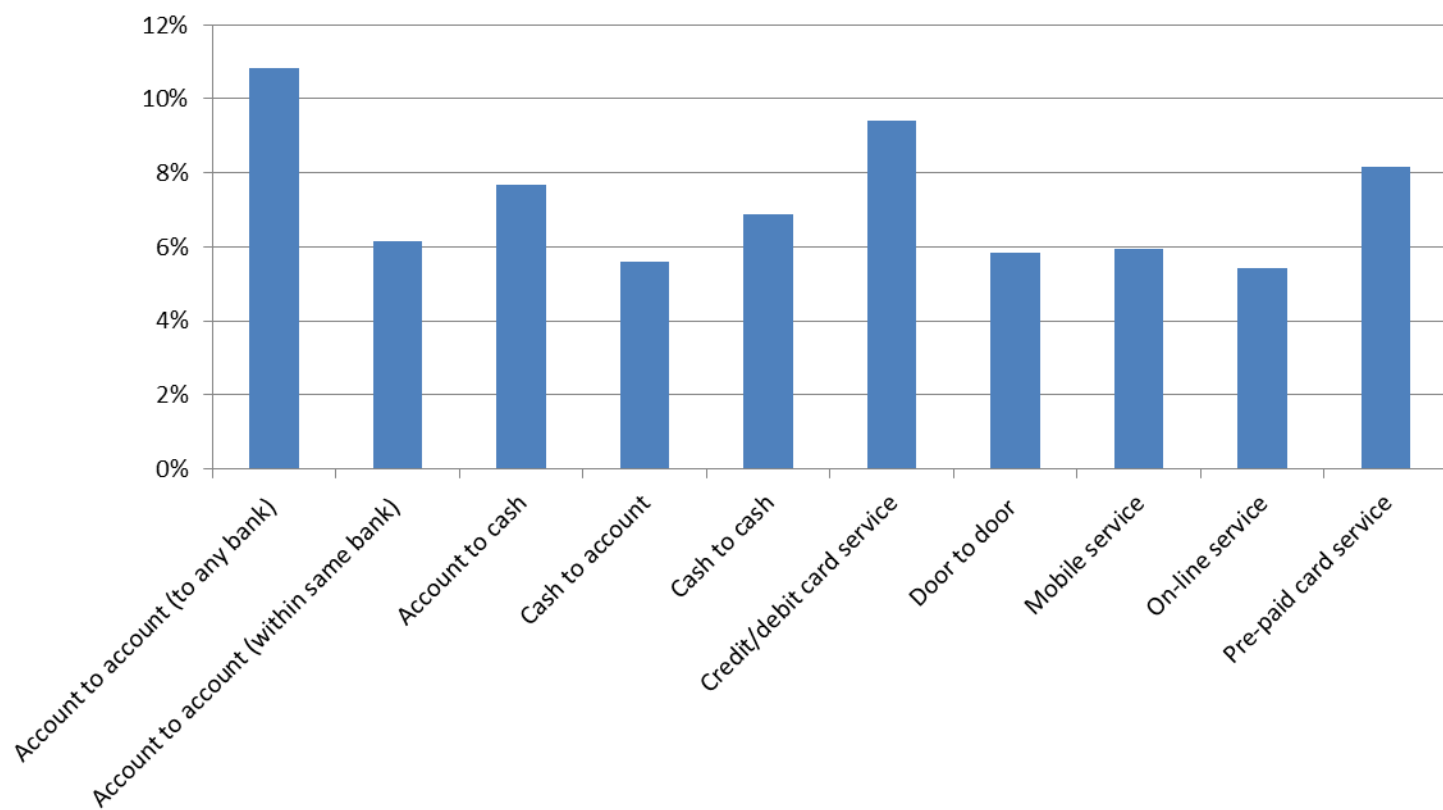

Costs by product type

Cash services remain the most widely available (47 percent of the sample) and one of the cheapest ways to send money, with an average cost of 6.89 percent, as shown in Figure 11Error! Reference source not found..

Account to account services remain the most expensive product type at 10.83 percent and are now the second most represented product type in the sample (20 percent). The cost of transfers within the same bank (or to a partner bank in the receiving country) is significantly cheaper (6.16 percent).

Online products are the cheapest product type, at an average cost of 5.32 percent, and are also increasingly more represented in the sample (approximately 18 percent of the sample). A number of providers are emerging in the online space, offering senders different options to pay for the transaction (from their bank accounts, with either a wire transfer or direct debit, or by debit or credit card). The sender can also choose different ways for the money to be delivered, for example to the beneficiary’s bank account or in cash at an agent in the receiving country (however, this generally increases the total cost of the transaction).

Figure 11 Average cost by product type

See note iv for list of abbreviations

Notes

ⁱ The first iteration of the database was released in September 2008. For the following five years, the RPW database was updated every six months with data releases published for Q1 and 3Q 2009, Q1 and 3Q 2010, Q1 and 3Q 2011 and Q1, and 3Q 2012. Starting in 2013, the RPW database was updated on a quarterly basis.

ⁱⁱ All figures refer to the cost of sending USD 200 or the local currency equivalent.

ⁱⁱⁱ The regions' abbreviations are as follows: East Asia and Pacific (EAP), Europe and Central Asia (ECA), Latin America and the Caribbean (LAC), Middle East and North Africa (MNA), South Asia (SAR), Sub-Saharan Africa (SSA).

^{iv} The International MTOs Index includes all MTOs that are present in over 85 percent of RPW corridors. Thus far, it has included Western Union and MoneyGram, which operate in 99 percent and 92 percent of the country corridors covered in the database, respectively.

^v Figures for the global average were adjusted in Q1 2014 following a thorough clean-up of the entire database. Some values slightly vary from data published in the past.

^{vi} It is important to note that, while official data on remittance flows by bilateral corridors are currently not available, estimates (Ratha and Shaw 2007, last updated in 2014, available at <http://go.worldbank.org/JITC7NYTT0>) have been used in this calculation. These estimates are based on the Balance Of Payments (BOP) and factor in migrant stocks, destination country incomes, and source country incomes. The methodology for these estimates has been questioned, as well as the accuracy of official data on remittance flows and migrant stocks. However, this still represents the only available comprehensive dataset on bilateral remittance flows. It also seems likely that overall the dataset is sufficiently accurate to reflect at least the proportion between the different corridors, hence offering a good approximation to weight the relevance of each corridor in terms of flow size.

^{vii} In the final declaration of the Cannes Summit on November 3 and 4 2011, the G20 head of state committed to work towards the reduction of the average cost of transferring remittances from 10 to 5 percent by 2014. The G20 adoption of a target created the need for an index that specifically monitors the price of remittances in the G20 members. As some G20 countries are included in RPW as remittance senders, while others are listed as receivers, two different indexes are presented here: (1) average for sending remittances from the G20 member countries; and (2) average for sending remittances to the G20 member countries. The following G20 countries are included in RPW. Sending countries: Australia, Canada, France, Germany, Italy, Japan, Republic of Korea, Russia, Saudi Arabia, United Kingdom, and the United States. Receiving countries: China, India, Indonesia, Mexico, and Turkey. Countries that are both sending and receiving: Brazil and South Africa. Argentina is not included in RPW. The European Union does not appear as such in RPW, although most EU member countries are included in the database.
